Methycobal® injection 500 µg

METHYCOBAL is a clear, red injection containing the following ingredients, and contained in brown ample (one-point-cut type).

INDICATIONS
Peripheral neuropathies
Megaloblastic anemia caused by vitamin B12 deficiency

PRECAUTIONS
1. Adverse Reactions
Adverse reactions were reported in 13 of 2,872 patients (0.45 %). (At the end of the reexamination period)

(1) Clinically significant adverse reactions (incidence unknown)

Anaphylactoid reaction
Anaphylactoid reaction such as decrease in blood pressure or dyspnea, may occur. Patients should be carefully observed. In the event of such symptoms, treatment should be discontinued immediately and appropriate measures taken.

(2) Other adverse reactions

<td>Incidence unknown</td>
<td>Diaphoresis and pain/induration at the site of intramuscular injection</td>
</tr>
</tbody>
</table>

Note: In the event of such symptoms, treatment should be discontinued.

2. Precautions concerning Use

(1) Administration
METHYCOBAL is susceptible to photolysis. It should be used promptly after the package is opened, and caution should be taken so as not to expose the ampules to direct light.

(2) Intramuscular administration
In intramuscular administration, caution should be exercised by following the instructions mentioned below to avoid adverse effects on tissues or nerves.

1) Avoid repeated injection at the same site. Particular caution should be exercised when administering METHYCOBAL to prematures, neonates, nursing infants and children.
2) Do not inject in densely innervated site.
3) If insertion of the injection needle causes intense pain or if blood flows back into the syringe, withdraw the needle immediately and inject at a different site.
(3) Opening the ampule

METHYCOBAL is supplied in one-point-cut ampules. The cut point of the ampules should be wiped with an alcohol swab before opening.

PHARMACOKINETICS

1. Single-dose administration

Mecobalamin was administered intramuscularly or intravenously to 12 healthy adult male volunteers at a single dose of 500 µg. The time to reach peak serum total vitamin B₁₂ (abbreviated to B₁₂) concentration (t_{max}) was 0.9 hr after intramuscular administration and immediately to 3 min after intravenous administration, and the increment (except endogenous serum total B₁₂) in peak serum total vitamin B₁₂ concentration (ΔC_{max}) was 22.4 ng/mL after intramuscular administration and 85.0 ng/mL after intravenous administration.

The area under the serum total vitamin B₁₂ concentration-time curve (ΔAUC) calculated by increment of the actual values at 144 hr after administration was 204.1 ng ⋅ hr/mL after intramuscular administration and 358.6 ng ⋅ hr/mL after intravenous administration.

On the other hand, the rate of binding saturation showed a similar increase in both groups of subjects for 144 hr after administration. ¹)

<td>0.9±0.1</td>
<td>27.1</td>
</tr>
</tbody>
</table>

Mean ± S.E., n=12

2. Repeated-dose administration

Mecobalamin was administered intravenously to 6 healthy adult male volunteers at a single dose of 500 µg daily for 10 consecutive days. Serum total B₁₂ concentration determined before each administration increased from day to day. After 2 days of administration, the serum total B₁₂ concentration was 5.3±1.8 ng/mL, about 1.4 times the 24 hr value (3.9±1.2 ng/mL) after administration. At 3 days of administration it had increased to 6.8±1.5 ng/mL, about 1.7 times the 24 hr value, and this concentration was maintained until the last dosing. ¹)

CLINICAL STUDIES

Clinical efficacy

Mecobalamin was administered intramuscularly to patients with peripheral neuropathies at a single doses of 500 µg and 100 µg (low-dose group) daily 3 times a week for 4 consecutive weeks in a double-blind clinical trial. In the chronic stage and fixed stage of peripheral neuropathies in the 500 µg group aggravation of symptoms was significantly suppressed compared to the low-dose group and this dose was thus demonstrated to be useful. ²)

In a placebo-controlled double-blind clinical trial, mecobalamin was administered intravenously or intramuscularly to patients with peripheral neuropathies at a single dose of 500 µg daily 3 times a week for 4 consecutive weeks. The improvement rate for intravenous administration was 38.7% (24/62) for moderately to remarkably improved and 74.2% (46/62) for fairly to remarkably improved. The improvement rate for intramuscular administration was 46.3% (25/54) for moderately to remarkably improved and 81.5% (44/54) for fairly to remarkably improved. The equivalence of mecobalamin efficacy for both administration routes was thus demonstrated. The diseases of subjects in the trial were diabetic neuropathy, polyneuritis, cervical spondylitis, sciatica, alcoholic neuropathy, facial paralysis and mononeuritis, etc. ³)

When mecobalamin was administered to patients with megaloblastic anemia due to vitamin B₁₂ deficiency, their hemograms and symptoms improved in 3 weeks to 2 months after starting administration.

PHARMACOLOGY

1. Mecobalamin is a kind of endogenous coenzyme B₁₂

Mecobalamin plays an important role in transmethylation as a coenzyme of methionine synthetase in the synthesis of methionine from homocysteine.

2. Mecobalamin is well transported to nerve cell organelles, and promotes nucleic acid and protein synthesis.

Mecobalamin is better transported to nerve cell organelles than cyanocobalamin in rats. It has been shown in experiments with cells from the brain origin and spinal nerve cells in rats to be involved in the synthesis of thymidine from deoxyuridine, promotion of deposited folic acid utilization and metabolism of nucleic acid. Also, mecobalamin promotes nucleic acid and protein synthesis in rats more than cobamamide does. ⁴ - ⁶)

3. Mecobalamin promotes axonal transport and axonal regeneration.

Mecobalamin normalizes axonal skeletal protein transport in sciatic nerve cells from rat models with streptozocin-induced diabetes mellitus. It exhibits neuropathologically and electrophysiologically inhibitory effects on nerve degeneration in neuropathies induced by drugs, such as adriamycin, acrylamide, and vincristine (in rats and rabbits), models of axonal degeneration in mice and neuropathies in rats with spontaneous diabetes mellitus. ⁷ - ¹²)

Mecobalamin promotes the synthesis of lecithin, the main constituent of medullary sheath lipid and increases myelination of neurons in rat tissue culture more than cobamamide does. ¹³, ¹⁴)
5. Mecobalamin restores delayed synaptic transmission and diminished neurotransmitters to normal.
Mecobalamin restores end-plate potential induction early by increasing nerve fiber excitability in the crushed sciatic nerve in rats. In addition, mecobalamin normalizes diminished brain tissue levels of acetylcholine in rats fed a choline-deficient diet.\(^{15,16}\)

6. Mecobalamin promotes the maturation and division of erythroblasts, thereby alleviating anemia.
It is well known that vitamin B\(_{12}\)-deficiency may cause specific megaloblastic anemia. Mecobalamin promotes nucleic acid synthesis in bone marrow and promotes the maturation and division of erythroblasts, thereby increasing erythrocyte production. Mecobalamin brings about a rapid recovery of diminished red blood cell, hemoglobin, and hematocrit in vitamin B\(_{12}\)-deficient rats.

PHYSICOCHEMISTRY
Nonproprietary name: Mecobalamin (JAN, INN)
Chemical name:
Co \(\alpha\)-[\(\alpha\)-(5,6-Dimethylbenz-1H-imidazolyl)]-Co\(_{\beta}\)-methylcobamide
Molecular formula: \(\text{C}_{63}\text{H}_{91}\text{CoN}_{13}\text{O}_{14}\text{P}\)
Molecular weight: 1,344.38
Structural formula:

![Structural formula of Mecobalamin]

Description:
Mecobalamin occurs as dark red crystals or crystalline powder. It is sparingly soluble in water, slightly soluble in ethanol (99.5), and practically insoluble in acetonitrile. It is affected by light.

PRECAUTION FOR HANDLING
METHYCOBAL is packaged in the LPE pack (Light Protect Easy open pack) to ensure quality during storage. The LPE pack should be opened immediately before using.

PACKAGING
METHYCOBAL Injection 500 \(\mu\)g (1mL)
Boxes of 10 and 50 ampules
